1. A 2x2 ROM array is built with the help of diodes as shown in the circuit below. Here W0 and W1 are signals that select the word lines and B0 and B1 are signals that are output of the sense amps based on the stored data corresponding to the bit linesc during th read operation.

During the read operation, the selected word line goes high and the other word line is in a high impedance state. As per the implementation shown in the circuit daiagram (Fig. 1) above, what are the bits corresponding to D_{ij} (where i=0 or 1 and j=0 or 1) stored in the ROM?
